

REQUIREMENTS CATEGORIES

BA 3rd Ed 208

Categories of requirements

General

- Business constraints
- Business policies
- Legal
- Branding
- Cultural
- Language

Technical

- Hardware
- Software
- Interoperability
- Internet

Functional

- Data entry
- Data maintenance
- Procedural
- Retrieval

Non-functional

- Performance
- Security
- Access
- Backup & recovery
- Archiving & retention
- Maintainability
- Business continuity
- Availability
- Usability
- Accessibility
- Capacity

General business requirements

- Business constraints
- Business policies
- Legal
- Branding
- Cultural
- Language

General business requirements

- e.g. The system must be compliant with ISO9001.
- e.g. The system shall display the corporate motto on all front/welcome screens.
- e.g. The system must display screens in American English and French.
- e.g. The system must be compliant with the Financial services act.

Technical requirements

BA 3rd Ed 209 - 210

Technical constraints

- mandated solutions placed on the project
- Hardware
- Software
- Interoperability
 - Describing required interfacing with other systems and/or equipment
- Internet
 - Governing the use of the internet or web-enabled services

Technical requirements

- e.g. The system must support Office 2010 applications.
- e.g. The system shall run with on systems with 2GB of RAM.
- e.g. The system must run on Android and IOS.
- e.g. The system must be able to receive files from the organisations current digital cameras.
- e.g. The system must prevent the display of any .xxx domains.

Functional requirements

“Setting out a feature that any solution should provide”

- Data entry
- Data maintenance
- Procedure requirements
- Data retrieval

BA 3rd Ed 210 - 211

Functional requirements

- e.g. The system shall record details of name, house number, street name and postcode.
- e.g. The HR manager must be able to generate a summary report displaying all new users added in the last calendar month.
- e.g. The system must be able to generate a list of quotes based on criteria selected by a customer.
- e.g. The events manager must be able to add details of new events on to the system.

Non-functional requirements

- Performance
- Security
- Access
- Back up and recovery
- Archiving and retention
- Maintainability
- Business continuity
- Availability
- Usability
- Accessibility
- Capacity

BA 3rd Ed 211 - 213

Performance

“The speed at which a transaction should be processed”

If a customer wants to place an order or make a booking, this kind of requirement would define the speed of the processing that is done to handle this.

e.g. The system will generate reports in 7 seconds.

e.g. The system must process an order within 20 seconds.

e.g. The system shall notify customers of the result of their application within one minute.

e.g. The system shall print a colour page in less than 25 seconds 90% of the time.

BA 3rd Ed 211

Security

“The security levels required for the organisations information and data.”

Some information or data will be highly confidential and will require extremely rigorous security but other kinds might be subject to much less security. Storage requirements for this information and data may also be defined here.

e.g. The system will prevent access from hackers and the interception of data

e.g. The system must store credit card details using unbreakable encryption.

e.g. All system data must be stored on a RAID

BA 3rd Ed 211

Access

“The levels of access to the information and data for our stakeholder groups”

These requirements will state which stakeholders can carry out which transactions/interactions. Which stakeholders can delete customer records or pay an invoice to a supplier?

These are likely to relate to security and functional requirements.

e.g. Only managers shall be allowed to delete customer records.

e.g. Access to the system shall be restricted to registered users.

e.g. The system must only allow managers to view reports.

BA 3rd Ed 211

Back up and recovery

“Protecting against loss of information and data”

Retaining data is as vital as keeping it secure and controlling access to it. These requirements will define the policy for preventing any loss.

- e.g. The system will perform a full backup every Wednesday.
- e.g. The system shall transfer a backup to an offsite server every fortnight.
- e.g. The system will copy all backup files to 3 separate storage locations.
- e.g. The system must support the creation of tape drive backups.

BA 3rd Ed 211

Archiving and retention

“Duration of retention, archiving methods and disposal”

Retaining information and data is as vital as keeping it secure and controlling access to it. These requirements will define the nature of the archiving methods as well as the approaches to be taken to the disposal of information and data.

e.g. The system shall maintain an access log for one year.

e.g. The system must store customer details for three years.

e.g. The system will delete all files using a triple pass data shredder algorithm.

BA 3rd Ed 211

Maintainability

“Concerned with maintaining the solution”

This will define the approach to be taken to aspects such as servicing, problem investigation and correction.

e.g. The system shall produce a log for each failure.

e.g. The system will be serviced once a month.

e.g. System updates should only be installed outside of the business hours.

BA 3rd Ed 211

Business continuity

“The ability of the organisation to continue to function in the face of various threats.”

e.g. The system must be operational after a severe system failure within 8 hours.

e.g. The system shall have a 99% uptime.

BA 3rd Ed 211 - 212

Availability

“When the solution must be available to stakeholders”

This will define the level of availability required of the solution from each of the stakeholder groups.

e.g. The system shall be available from 7am to 7 pm everyday.

e.g. The system shall be available from 8:30 to 18:00 on every business day.

e.g. The recorded message service must be active outside of the business hours.

e.g. The system must be available 24/7.

BA 3rd Ed 212

Usability

“Ease of learning and navigation”

Internal business stakeholders can be trained but this will not be possible for external stakeholders such as customers. These requirements will define speed of learning and the number of clicks needed to obtain information.

- e.g. Front office staff will be able to use the system with only one day of training.
- e.g. Customers should be able navigate to their personal details in no more than 2 clicks.
- e.g. Staff should be able to generate reports within 5 clicks.
- e.g. The new customer registration process should take no more than 4 minutes to complete.

BA 3rd Ed 212

Accessibility

“Enabling access to all:
Cognitive, Motor, Hearing, Visual disabilities”

e.g. Provide screen reading tools

e.g. Use images rather than text

e.g. Use access ramps and lifts

e.g. Consider height and positioning of buttons in lifts

BA 3rd Ed 212 - 213

Capacity

“How much data and information will there be”

This will define the volumes of information and data to be stored, volumes of transactions to be processed and number of stakeholders to be supported.

- e.g. The system must be able to store 1,000,000 customer records.
- e.g. The system must be able to process 30 orders at once.
- e.g. The system shall be capable of handling 40 simultaneous users.
- e.g. The system must be able to store the details of 300 million transactions.

BA 3rd Ed 211

Requirements classification example

Classify the requirements for the banking example in Annex 1.

General	Technical	Functional	Non-functional
• Business constraints • Business policies • Legal • Branding • Cultural • Language	• Hardware • Software • Interoperability • Internet	• Data Entry • Data maintenance • Procedure requirements • Data retrieval	• Performance • Security • Access • Backup & recovery • Archiving & retention • Maintainability • Business Continuity • Availability • Usability • Accessibility • Capacity
